Introduction

Heart failure remains a major health problem despite considerable advances in treatment and management. Hence a continuum-of-care concept will benefit the individual client and enhance primary care with the development of new approaches for treatment. Clinicians and health care providers encounter challenges by the growing numbers of heart failure cases and to improve patients' outcome. A series of in-depth discussions will enlighten participants to discover the best means of utilizing new approaches to treat heart failure. This includes: latest guidelines, invasive & noninvasive monitoring devices, surgical intervention, pharmacotherapy options and recommended therapies that will enhance prevention and lead to improved outcomes for heart failure clients.

Objectives

At the end of this symposium participants should be able to:

- ♥ Incorporate the evidence based guidelines for heart failure management
- ♥ Understand the advanced surgical therapies for end-stage heart failure
- ♥ Enhance their knowledge with current recommendations, treatment options and best practices available for heart failure management.
